3D effect *with* Chat GPT

This effect is great for adding 3D textures to our logos. The result is not exact, but it's a good first step for our projects.

Steps:

1. Upload the texture. If it has transparency, that's even better — it helps the AI better recognize the texture's parameters. You can search for this type of texture on Google using the term “matcaps.” A recommended site is blenderkit.com. You'll need to sign up to access free images. Just right-click and “save image.” Most of them come in .WEBP format, which works perfectly fine since ChatGPT supports it.

2. Upload your logo. It's important that it's in black and white and in high resolution. This is necessary so that ChatGPT can recognize the contrast between the logo shape and the background.

3. Write the following prompt:

“Apply the texture from the image on the left to the logo in the image on the right and make it look 3D. Rendered in Cinema 4D, 8k. Maintain the logo's shape and orientation. Keep the background black. Give it a high contrast between light and shadow.”

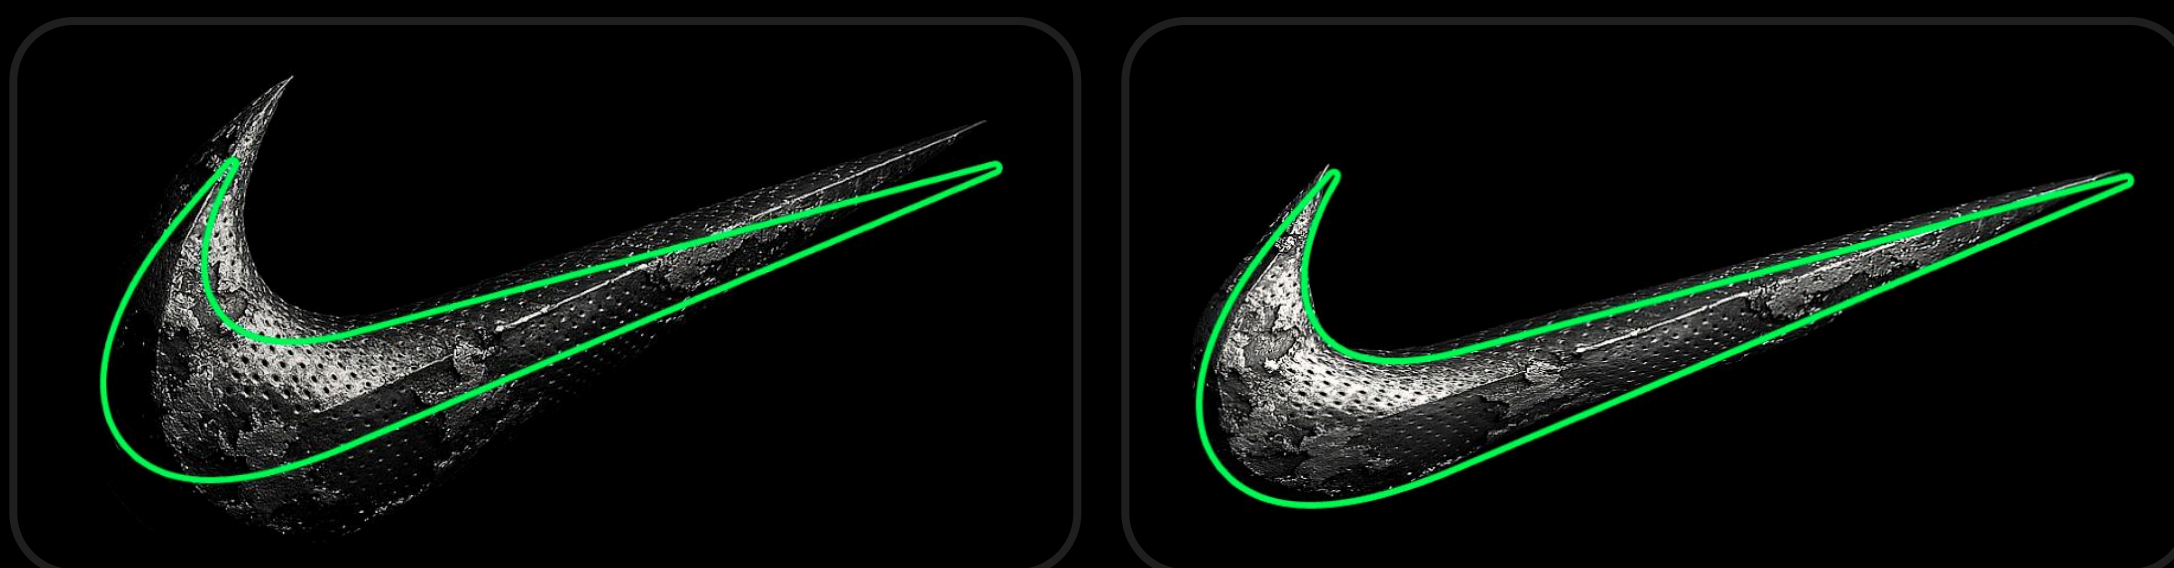

Remember that the first instruction should tell it what to do with the two uploaded images. Then, specify that you want a 3D result. You can also include specific details, such as making it look like a Cinema 4D render, or improving the lighting and contrast.

Things to keep in mind:

1. It's recommended to upload the texture as a transparent sphere for better results, but you can also try using fill textures or even any kind of image (just make sure to specify in the prompt that you want to extract the texture from that image).

2. The logo might be slightly modified in the results. To avoid this, it's a good idea to write in the prompt that you want to maintain the original shape of the logo.

3. In the prompt, you can also specify the type of background you want in the image, and whether it needs more lighting or a specific color tone.

Remember:

It's important to understand that AI tools don't give us final results — they're just tools to enhance our work. This prompt can be modified to fit your needs. If you don't get a great result, I recommend making adjustments in Photoshop.

Hope this helped you out 🙌🙌
